Biokinetics and Biodynamics of Human Differentiation Erich Blechschmidt, M.D.,R.F. Gasser, Ph.D..2012-05-15

Fifty years ago the field of human embryology was incomplete; prior to that time the anatomy of early human embryos was still unknown, and there was much to be learned about the older stages of human embryonic development. It is now understood that human organs result from step-by-step differentiations of the growing human embryo. Research by renowned embryologist Erich Blechschmidt, MD, showed that differentiations are not only the result of a gene effect, but are also brought about through growth initiated by extragenetic (occurring outside the gene) information. Without this extragenetic information the differentiation would not begin. Dr. Blechschmidt and coauthor Raymond Gasser, PhD, maintain that Haeckel's biogenetic law (ontogeny recapitulates phylogeny) was an erroneous attempt to explain developmental processes. Blechschmidt's human embryological investigations showed that Darwin's principles (mutation and selection) are likely valid for the origin of the species, but that they cannot explain the ontogenesis of the organs. The ontogenesis of each individual cannot be derived from phylogenetic facts. The authors stress that a clear distinction must be made between the vast field of phylogenetics and the much more exact and understandable field of ontogenetics—particularly the process of differentiation—and their goal is to present not only the abstract biokinetic principles of differentiation, but the originality of embryonic human beings as well. Their knowledge of developmental movements leads to their conclusion that differentiation is an undivided biodynamic process that occurs during development and includes the chemical processes as well. Logically organized into two sections (the first covers early metabolic fields and includes chapters on the one-cell human ovum, the early embryo, blood vessels, the nervous system, head region, trunk, and limbs; the second describes metabolic fields in later developmental stages, distinguishing fields of corrosion, densation, contusion, distusion, retention, dilation, liquation, and detractation), *Biokinetics and Biodynamics of Human Differentiation* warrants reading by thoughtful professionals in a number

of fields concerned with embryonic differentiation. A new preface by Dr. Gasser addresses how the book's principles and findings were and are understood in the field of human embryology.

Human Embryology William James Hamilton, J. D. Boyd, Harland Winfield Mossman. 1952 Textbooks of human embryology are so rare that this substantial contribution is most welcome. Its chapters on early stages of human development are excellent (IV to VII). They contain a photograph of the 7 1/2 day ovum and an interpretation of the yolk sac which is in accord with the latest original contribution to this subject. Chapter VIII (determination, differentiation, the organizer mechanism, abnormal development and twinning) is more effective than its brevity might suggest (10 pages). In fact it serves as keynote for the chapters which follow. Evidently it was written too early to incorporate observations on rubella as an etiological factor in congenital cataract and malformations of the heart.
