THIS IS REDSTONE MISSILE WEAPON Chrysler Corporation Missile Division, 2012-05 Named in honor of the Redstone Arsenal in Huntsville Alabama where it was developed, the SSM-A-14 Redstone was the first large ballistic missile in the U.S. inventory. Designed by the Army Ballistic Missile Agency under the leadership of the brilliant Wernher von Braun, Redstone was a direct descendant of the A-4 / V-2 rocket produced in Nazi Germany. Design work on the missile was finished in 1952. It incorporated many innovations including inertial guidance and a separable warhead section that, by decreasing drag, increased the weapon's range. Steerable rudders and refractory carbon vanes mounted in the rocket engine's exhaust, ensured course control. Redstone first flew on August 20, 1953 although the result was inauspicious - it traveled a mere 4.5 miles. Test flights continued over the next five years, and many refinements were made to ensure reliability. The final production version had a range of just over 200 nautical miles, or 175 carrying a W-39 nuclear warhead. In August of 1958, a Redstone became the first American missile to participate in a nuclear test, detonating a 3.8 megaton warhead as part of Operation Hardtack. In the field however, the Redstone missile proved cumbersome to move into position and time consuming to activate. The process could require twenty support vehicles and eight hours of work. A minimum of fifteen minutes' fueling time - an eternity in a combat situation - was needed after receiving a launch order. The solid fueled Pershing missile, which replaced the Redstone in late 1964, overcame these shortcomings. While Redstone's role as a weapon system was brief, it had a major impact on America's early space program. In January of 1958, just four months before the U.S. Army activated the Redstone in Germany, a modified version designated Jupiter-C put Explorer, America's first satellite, into orbit. In 1961, the Mercury-Redstone Launch Vehicle lifted Alan Shepard into space. Originally created in 1959 by prime contractor Chrysler Corporation, which built 101 of the 128 missiles produced, This is Redstone provides a detailed overview of this historic weapons system. It includes chapters about the missile's structure, operation, propulsion and propellant systems, ground support equipment, guidance and controls, firing site operations, and more.

A Short Course in Inertial Navigation and Missile Guidance David A Cicci, 2021-08-03 This is a short course covering basic and advanced topics inertial navigation and missile guidance. This course is structured to present the fundamental concepts without the in-depth theoretical background and many of the mathematical derivations that commonly accompany an academic presentation of the subject. My intention was to introduce navigation and guidance in a simplified manner to those with no previous background in the field, or to provide a review to those who have studied the subjects previously. Readers should have a familiarity with differential and integral calculus and differential equations to help understand some equations presented. The form of this short course is like the many short courses I've taught at government agencies and private corporations during my thirty-five-year career as a professor of aerospace engineering at Auburn University. It presents the material in a simple outline/bullet format using many understandable figures, rather than using lengthy, detailed explanations with complex mathematical derivations and proofs. It provides the practical equations that are useful to

the practicing engineer. The objectives of this short course are to: - Review the navigation, guidance, and control process and the role of inertial navigation. - Discuss the concept and functionality of inertial sensors and their role in inertial navigation. - Present the coordinate systems and coordinate transformation methods used in inertial navigation. - Explain Newton's Second Law and its application to inertial navigation. - Review how the mechanization equations are developed and used in inertial navigation, including gravitational modeling. - Present the sources of navigation errors and how they are mathematically modeled. - Introduce the concepts of GPS-aided inertial navigation systems, along with possible filtering and coupling approaches. - Examine missile modeling techniques and equations of motion used in missile guidance. - Review the fundamentals of missile guidance methods and guidance system models. - Provide an overview and performance comparison of classical guidance laws. - Describe the concept of Linear Quadratic Guidance theory and its use in the development of advanced guidance laws. - Introduce how inertial measurement units can be modeled mathematically. The material presented is usually covered in graduate level course except that there's no required homework, quizzes, projects, computer programs to write, or examinations. I believe that even a novice reading through this material will gain an in-depth understanding of the subjects covered. The material presented is not easy, but it can be enjoyably simple once the fundamentals are understood. To that end, I've attempted to present the difficult concepts as clearly as possible to facilitate that understanding. This short course is part of a series I've developed as a Professor at Auburn University. Others in this series include: Orbital Mechanics, Part I: The Two-Body Problem Orbital Mechanics, Part II: Satellite Perturbations State Estimation and Kalman Filtering: Fundamentals of Orbit Determination David A. Cicci Auburn, Alabama ciccida@auburn.edu
